

#### Managing Energy at Your Small Drinking Water System – A Workshop Series for New Hampshire Utilities

Workshop 1 – 07/19/16 Ashland Fire Station, Ashland, NH

Facilitator – Stacey Isaac Berahzer

This program is made possible under a cooperative agreement with EPA.

Environmental Finance Center Syracuse University

### Energy Management Program Development

**Energy Management Workshop 1** 

#### Energy Management Program -Basic Steps

- Step 1. Establish Organizational Commitment
- Step 2. Develop a Baseline of Energy Use
- Step 3. Evaluate the System and Collect Data
- Step 4. Identify Energy Efficiency Opportunities
- Step 5. Prioritize Opportunities for Implementation
- Step 6. Develop an Implementation Plan
- Step 7. Provide for Progress Tracking and Reporting

Source: NYSERDA

#### Step 1 – Establish Organizational Commitment

- Is your team defined? Is your team diverse?
- Does it represent various interests and responsibilities within the facility? (Owner, operators, users?)
- Team responsibilities include: develop the plan, establish goals, define the resources needed, provide information to others (i.e. CIP team)

### Why bother?

- Without the commitment of several individuals at varying levels within your utility, successful implementation of an energy management plan will be difficult
- Think of The Avengers no one individual could have saved the city; it took all of them working towards a common goal to be successful!

MENTAL FINANCE CENTE

#### Step 2 - Developing An Energy Baseline – What Should You Do?

- Gather basic information
  - One year of data minimum
  - Examples: utility billing records, O&M records, equipment or motor lists (horsepower & load)
- Organize treatment processes by functional area
- Evaluate energy bills and understand the energy rate structure

#### Developing An Energy Baseline – What Else Should You Do?

- Review facility use data and compare it to energy use
  - Identify wet weather, seasonal patterns
- Build a basic 'model' to organize data, and capture energy use patterns
- Create basic graphics and reports to communicate initial findings

### Why bother?

- Energy efficiency gains = \$\$ saved
  - The process of investigating energy use, and improving awareness among staff, can provide measurable energy efficiency gains on the order of 3-5%.
- Value shown before resources committed
  - Successfully developing a basic understanding of energy use can be a good 'early victory,' allowing the team to demonstrate some value even before any significant resources are committed to the program.

# Step 3- Evaluate the System and Collect Data

- This step goes beyond the baseline development (historical records). It involves data collection in the field
  - System walk-through (note operational information, motor sizes, etc.)
  - Staff interviews (operational practices, maintenance practices/history, take suggestions)
  - Energy performance data (field data from direct measurements, average equipment run time, submetering, etc.)

# Step 4: Identify Energy Efficiency Opportunities

- Energy efficiency opportunities can be defined as any system change that helps to reach a stated energy management goal.
- At this stage the energy management team should identify a broad array of energy efficiency opportunities

### Categories for Energy Efficiency Opportunities

- Capital program or equipment replacement
- Process change
- Operational change
- Automation or controls
- Maintenance improvements
- Business measures

# Step 5: Prioritize Opportunities for Implementation

- The final product of this step is a short list of energy efficiency opportunities that have been selected and carefully evaluated out of the list of opportunities generated in the previous step
- Identify a consistent method to compare and rank opportunities (consider both the monetary and non-monetary)

#### Keys to Success

- Convert all energy efficiency opportunities characteristics two monetary terms whenever possible
- Evaluate all energy management, including ancillary benefits when possible
- Test the sensitivity of results to determine the impact of important assumptions (e.g. time horizons)
- Make sure that the final results make sense in terms of the utility's capabilities

# Step 6: Develop an Implementation Plan

- How to Do It Business Plan
- Actions required in this step include the following:
  - List the projects chosen for implementation and describe the goals and objectives of the program
  - Explain the resources needed, including a budget and financing plan
  - Develop any specifications needed, including design criteria and procurement related documents
  - Provide any changes in standard operating procedures, and/or process control strategies
  - Set the schedule for implementation, including milestones and gaining the necessary regulatory approvals (if applicable)
  - Set realistic expectations for the project in terms of resources required, schedule, procurement time frame, and expected results

#### Step 7: Provide for Progress Tracking and Reporting

- The success of a project should be measured as it is being implemented
- The specific actions required in this step include the following:
  - Assign the responsibility for tracking the progress of a project and reporting on that progress. Allocate the resources necessary to fulfill the responsibilities.
  - Set the performance metrics that will be used.
  - Create a communication plan. Identify who needs to be included in progress reports (examples: elected officials, public, etc.), when reports should be made, and any actions that need to occur in response to reports.

#### Constraints on Implementing an Energy Program

### Constraints on Implementing an Energy Program

- Organizational constraints
- Capital costs
- Process reliability
- Regulatory requirements and limits
- O&M capabilities, and non-energy O&M costs
- Engineering constraints
- Space availability
